Adding life to life

A complete offer to ensure a long and happy life

Every human being wants to enjoy life at its best for as long as possible. To achieve this, appearance, fitness, intellectual capacities and health all have to be preserved.

A long life is everyone's dream, on the condition that it can be led as we would want it.

Nescens was created to accompany those of us who are interested in preserving their youth capital.

Nescens is the result of the medical and scientific expertise of the Centre for the Prevention of Aging of the Clinique de Genolier in Switzerland. The center was created over 15 years ago by Professor Jacques Proust, a pioneer in the biology of aging and anti-aging medicine.

Men's Health Program

Prevention and treatment of male-specific, age-related pathologies

Specially designed for men over the age of 40

Who is this program aimed at?

The Nescens Men's Health Program is a medical program that specializes in the detection, prevention and treatment of age-related, male-specific diseases and pathophysiological alterations.

What does this program consist of?

Following a consultation and a preventive medicine biological assessment, the physicians involved in carrying out this program (doctors of internal medicine, urologists, andrologists, etc.) take care of hormonal deficiencies (male hormone production deficit), prostatic problems (urinary disorders), and sexual disorders (erectile dysfunction), as well as defects in bone mineralization (osteoporosis) and loss of muscle mass (sarcopenia).

How does your program unfold?

Medical consultations

- Internal/preventive medicine consultations (initial and final)
- Urology/andrology consultation

Laboratory analyses including over 50 markers:

1. Biological markers
2. Metabolic markers
3. Bone metabolic markers
4. Cardiovascular risk markers
5. Tumor markers
6. Hormone assays
7. Vitamin assays
8. Screening for sexually transmitted diseases
9. Urinalysis (sediment, total proteins, microalbumin)

Medical Imaging:

- Abdomen and pelvic ultrasound including a prostate examination
- Measurement of bone mineral mass (quantitative computed tomography)
- Measurement of muscle mass and body fat (body composition using DEXA)

Complete written report

Additional services may be offered: sexology consultations, cosmetic medicine and dentistry, hair implantation, nutritional and sports coaching.
